Supplementary Table S1. Summary of cytopathological diagnoses in 31 patients who underwent FNA of pancreatic lesions two or more times

Cytopathological diagnosis		
At first FNA	At second or third fine-needle aspiration	No. of patients (%)
Negative for malignancy	Negative for malignancy ^a	8 (25.8)
	Atypical cell present	2 (6.5)
	Suspicious for malignancy	1 (3.2)
Atypical cell present	Malignant cell present	2 (6.5)
	Negative for malignancy ^b	3 (9.5)
	Atypical cell present	2 (6.5)
	Suspicious for malignancy	2 (6.5)
Suspicious for malignancy	Malignant cell present	8 (25.8)
	Negative for malignancy	1 (3.2)
	Malignant cell present	2 (6.5)

^aOne patient who underwent fine-needle aspiration (FNA) three times is included, and all three cytopathological diagnoses were reported as 'negative for malignancy'; ^bOne patient who underwent FNA three times is included, and the three cytopathological diagnoses were, in order, 'atypical cells present', 'atypical cells present', and 'negative for malignancy'.
